Supplementary Notes

I think this text assumes an intimate familiarity with linear algebra, which is particularly evidenced in exercise 2.1. I am familiar with the notation that ket's, $\mid \Psi \rangle$, are column-vectors, and bra's, $\langle \Psi \mid$, are row-vectors. They are related via $|\Psi \rangle^{\dagger} = \langle \Psi \mid$. This allows us to calculate quantities such as $\langle \Psi \mid \Psi \rangle$ and $|\Psi \rangle \langle \Psi \mid$ via traditional matrix operations (see Lidar Ch. 2, A). In Mathematica, this means an extra set of curly braces.

The list does default to being a column-vector, but look how dot products are handled:

The lists return a standard dot product, but the arrays return a matrix multiplication! We want the behavior of the second case, as $|\Psi\rangle\langle\Psi|$ should indeed be a 2x2 matrix. In Schmied, this same result is achieved via the KroneckerProduct function (Kronecker Products are also covered in Lidar Ch. 2). This is why I say the text assumes an intimate familiarity with linear algebra - you need to know when to use the dot product and when to use the Kronecker product, versus just standard matrix multiplication.

In[74]:= KroneckerProduct[list, ConjugateTranspose[list]] // MatrixForm

Out[74]//MatrixForm= a Conjugate[a] a Conjugate[b] \ bConjugate[a] bConjugate[b]

Exercises

Q2.1

$$\begin{split} & \text{In}[49] \text{:= } \$ \text{Assumptions } = \theta \in \text{Reals } \&\& \ \phi \in \text{Reals;} \\ & \text{up}\left[\theta_-, \ \phi_-\right] \ \text{:= } \left\{ \left\{ \text{Cos}\left[\frac{\theta}{2}\right] \right\}, \ \left\{ \text{e}^{\text{I}\star\phi} \, \text{Sin}\left[\frac{\theta}{2}\right] \right\} \right\}; \\ & \text{dn}\left[\theta_-, \ \phi_-\right] \ \text{:= } \left\{ \left\{ -\text{e}^{-\text{I}\star\phi} \, \text{Sin}\left[\frac{\theta}{2}\right] \right\}, \ \left\{ \text{Cos}\left[\frac{\theta}{2}\right] \right\} \right\}; \end{split}$$

We can convert the bra to a ket via the Conjugate command.

 $In[46]:= up[\theta, \phi] // MatrixForm$ ConjugateTranspose[up[θ , ϕ]] // MatrixForm // Simplify

$$\left(\begin{array}{c} \mathsf{Cos}\left[\frac{\theta}{2}\right] \\ \mathbb{e}^{\mathbb{i}\;\phi}\,\mathsf{Sin}\left[\frac{\theta}{2}\right] \end{array} \right)$$

Out[47]//MatrixForm

$$\begin{pmatrix} \mathsf{Cos}\left[\frac{\theta}{2}\right] \\ \mathrm{e}^{-\mathrm{i}\,\phi}\,\mathsf{Sin}\left[\frac{\theta}{2}\right] \end{pmatrix}$$

1.

To show that the two states are orthonormal:

orthogonal - dot product is zero normal - magnitude (dot product with self) is one.

```
In[39]:= ConjugateTranspose[up[\theta, \phi]].dn[\theta, \phi] // Simplify
        ConjugateTranspose[up[\theta, \phi]].up[\theta, \phi] // Simplify
        ConjugateTranspose[dn[\theta, \phi]].dn[\theta, \phi] // Simplify
        ConjugateTranspose[dn[\theta, \phi]].up[\theta, \phi] // Simplify
Out[39]=
         {0}
Out[40]=
         1
Out[41]=
         \{\{1\}\}
Out[42]=
         {0}
```

If I want to manually check any math, I can remove the simplify command. It is a little frustrating that there isn't an easy way to simplify only the Conjugate part. It appears to be either all or nothing.

$$In[*] := \textbf{ConjugateTranspose[up[θ, ϕ]].dn[θ, ϕ]}$$

$$Out[*] := \\ -e^{-i\phi} Cos \left[\frac{Conjugate[θ]}{2} \right] Sin \left[\frac{\theta}{2} \right] + e^{-iConjugate[ϕ]} Cos \left[\frac{\theta}{2} \right] Sin \left[\frac{Conjugate[θ]}{2} \right]$$

2.

An important point of order here is that 1 in the text is shorthand for the identity matrix:

```
In[*]:= MatrixForm[IdentityMatrix[{2, 2}]]
Out[]//MatrixForm=
               1 0
               0 1
  In[@]:= MatrixForm[KroneckerProduct[{a, b}, {c, d}]]
Out[]//MatrixForm=
              ac ad
              bc bd/
  In[@]:= MatrixForm[
                KroneckerProduct[up[\theta, \phi], Conjugate[up[\theta, \phi]]]
                   + KroneckerProduct[dn[\theta, \phi], Conjugate[dn[\theta, \phi]]]
              ] // FullSimplify
Out[]//MatrixForm=
               1 0 \
               0 1
 ln[54]:= up[\theta, \phi].ConjugateTranspose[up[\theta, \phi]] // Simplify // MatrixForm
             \left( \begin{array}{cc} \mathsf{Cos} \left[ \frac{\theta}{2} \right]^2 & \frac{1}{2} \, \, \mathrm{e}^{-\mathrm{i} \, \phi} \, \mathsf{Sin} \left[ \theta \right] \\ \frac{1}{2} \, \, \mathrm{e}^{\mathrm{i} \, \phi} \, \mathsf{Sin} \left[ \theta \right] & \mathsf{Sin} \left[ \frac{\theta}{2} \right]^2 \end{array} \right)
```
